

WEEK 6 — API DEMONSTRATION

Read Operations Demo

Cardiac Patient Monitoring System

PREPARED BY

Backend Engineering Team

.NET Internship Program

DOCUMENT FOCUS

Pagination & Search

Patients API

1. Demonstration Scope

This document presents the API read-operation evidence from Week 6, organized by topic. The supplied Postman screenshots demonstrate pagination, search, gender filtering with sorting, and a combined query against the Patients endpoint.

2. Pagination

Patients API — Pagination

```
GET /api/Patients?page=1&pageSize=2
```

✓ 200 OK

The request uses **page** and **pageSize** to retrieve a specific subset of patient records. The Postman response demonstrates the paginated result and its response structure.

Figure 1 — Postman evidence for Patients pagination.

3. Search

Patients API — Search Filtering

```
GET /api/Patients?search=Ahmad
```

✓ 200 OK

The request applies a search term to the Patients endpoint. The response contains the matching patient records, demonstrating that search filtering is working through the API.

Figure 2 — Postman evidence for patient search using `search=Ahmad`.

4. Gender Filtering & Sorting

Patients API — Gender + Date of Birth Sorting

```
GET /api/Patients?gender=Male&sort=dob_desc
```

✓ 200 OK

The request combines a gender filter with descending DateOfBirth sorting. The response demonstrates that both query options can be applied to the same endpoint.

Figure 3 — Postman evidence for gender filtering and DateOfBirth sorting.

5. Combined Query

Patients API — Combined Read Operations

GET `/api/Patients?page=1&pageSize=2&search=Ahmad&gender=Male&sort=dob_desc`

✓ 200 OK

This scenario combines pagination, search, gender filtering, and sorting in one request, demonstrating that the read-operation features work together.

Figure 4 — Postman evidence for the combined query.

6. Demonstration Result

- Pagination — successfully demonstrated with a 200 OK response.
- Search — successfully demonstrated with a 200 OK response.
- Gender filtering + sorting — successfully demonstrated with a 200 OK response.
- Combined query — successfully demonstrated with a 200 OK response.

DOCUMENT ORGANIZATION

These read-operation screenshots are kept together as one demo section. The Day 4 transaction work should remain a separate section/document so the transaction workflow and rollback evidence are not mixed with the Patients read-operation demo.
